Recent activity

Summary I am currently a research fellow (RTD-A) at the Department of Computer Science & Engineering of the University of Bologna (UNIBO). I got the qualification as associate professor for 09/H1 (ASN Fascia II) in 2022. I have 44+ publications at international journals and conferences; my current H-Index is 16 (GScholar), 12 (SCOPUS). I got a PhD in CS & Eng. from UNIBO, with a thesis on awarded by the IEEE TCSC. I have been a visiting PhD student at the University of St Andrews (refereed by Prof. Simon Dobson) and at TU Wien (refereed by Prof. Schahram Dustdar). I got awards for research, service, and as a student. In 2014-15, I have also worked as a part-time software engineer. I am also involved in teaching activities: I am Adjunct Professor in various courses at BEng Degrees in Computer Science and Engineering.

Research Themes in a Nutshell

In a nutshell, my research interests and activity revolve around two main themes: **software engineering** and **distributed artificial intelligence**. In particular, I focus on paradigms, models, and techniques fostering intelligence and autonomy in socio-technical systems. My research may be considered in the context of fields like multi-agent systems, distributed cyber-physical systems, self-* systems, and collective intelligence.

 - **Contribution:** Development of the formal model; Writing - original draft, Writing - review & editing
 - **Short summary:** This work proposes an extension to field-based programming models whereby the scheduling of applications can be programmed by the applications themselves, leveraging the ideas of *triggers*, *causality fields* and *computation trees*. This enables a kind of “time-fluid” distributed computation where the computation rate can adapt to balance performance (system reactivity) and cost (resource usage). The model is formalised in terms of the structural operational semantics of a whole network of devices, implemented in the Protelis DSL, and validated through Alchemist simulations.

 - **Short summary:** This work presents a very general design pattern for decentralised feedback-regulated self-integration in dynamic environments. The *Self-organising Coordination Regions (SCR)* pattern consists of a dynamic distributed process involving leader election, coalition formation, and feedback loops between leaders and subordinates. The paper shows SCR has many known uses in literature and enjoys great versatility, shown via case studies in edge computing and hierarchical networks.
